

Table 1. 657 newly reported beetle species for the state of Rhode Island. 245 of these species (marked with an asterix ‘\*’) are not recorded from any New England state in Downie and Arnett (1996). ‘Determiner’ lists the taxonomist who identified the species and the voucher code of the collection(s) in which the specimen(s) reside. Listed under ‘Vouchers’ are the codes of the collections and publications that document the species from or in Rhode Island. See Appendix for complete list of vouchers sources. Values under ‘Page’ are the page number on which the species is listed in Downie and Arnett (1996). Distribution in Northeastern NA is taken from Downie and Arnett (1996) with ‘RI’ added. Values listed under ‘Continental’ indicate the distribution of the species in the 8 regions of the New World, north of South America used in Downie and Arnett (1996)(Fig. 1). Families and species are sorted phylogenetically. In brackets following each family name are the counts of species recorded from RI and the number of new state records respectively.

Species	Determiner	Vouchers	Page	Distribution in Northeastern NA	Continental
<b>Gyrinidae [ 17 / 7 ]</b>
