

The description of a new species of *Agrilus* Curtis, with distributional records, and taxonomic and biological notes for Agrilinae and Trachyinae (Coleoptera: Buprestidae) of Mexico and Central America

RICHARD L. WESTCOTT & HENRY A. HESPENHEIDE

Plant Division, Oregon Department of Agriculture, Salem, OR 97301-2532, e-mail rwestcot@oda.state.or.us; and Department of Organismic Biology, Ecology and Evolution, Box 951606, University of California, Los Angeles, CA 90095-1606 E-mail: hahiii@ucla.edu, respectively.

Abstract

This paper treats 225 species of Buprestidae in the genera *Agrilus*, *Brachys*, *Callimicra*, *Cyphothorax*, *Dismorpha*, *Hylaeogena*, *Leiopleura*, *Lius*, *Omochyseus*, *Pachyschelus*, *Paragrilus*, *Taphrocerus* and *Trypanitus*. New country records are recorded for Mexico and all Central American countries. *Agrilus vandenberghei* Westcott and Hespenheide, new species, from Central America and Mexico, and the male of *Agrilus eyai* Westcott and Noguera are described and figured. Rational is provided for changing *Agrilus aurilatera* Waterhouse to *A. aurilaterus*; *A. catherinae* Chevrolat is shown to be a justified emendation of *A. catharinae*; *A. complexus* (Waterhouse) is a new combination; and *A. consobrinus* Dugès is synonymized with *A. correctus* Thompson.

Key words: Buprestidae, Agrilinae, Mexico, Central America, distribution, new species

Introduction

There has been much interest of late in Buprestidae of Central America and especially Mexico, mostly of a descriptive nature, but also in biodiversity, faunal studies and cataloging efforts. The family is abundant, prominent and diverse in those areas; however, many species are known from one or a very few specimens. For most other species, even some of the more common ones, distributional data is incomplete. For Mexico alone Hespenheide (1996) included about 1,300 species (782 of them described), but suggested there may actually be closer to 2,000. Our data on the Agrilinae are based mostly on specimens we have examined, the majority of which were submitted to us for identification. The number of host records provided herein, indeed that are recorded in the

literature for these regions, is limited. Hosts remain unknown even for some of the most common species, and this subject is a fertile ground for endeavor on the entire family. This paper is intended to further our knowledge for the subfamily Agrilinae, particularly to make new information available for catalogs and faunal studies. The vast majority of information provided herein is new distribution records. However, we are describing one new species of *Agrilus* from Central America and Mexico because a great many specimens have been taken and distributed to collections in both the Old and New World. The additional records in this paper are from Mexico unless indicated as being from Central America, in which case they are new for the countries noted in the label data. Nine species are new to Belize, six to Costa Rica, seven to El Salvador, two to Guatemala, 27 to Honduras, one to Nicaragua, and eight to Panama. The 31 new country records for Mexico are clearly indicated in boldface type. Mexican state abbreviations (see below) printed in all capital letters indicate a new record. Within the data provided for new state/country records, we have not ascertained if adult hosts have been reported in the literature. Years of collection from the 20th Century are given as two digits; those from the 21st Century are cited in full.

Of special interest for distributional knowledge of Mexican Agrilinae are the collections made by G. B. Hinton and R. L. Usinger in the District of Temascaltepec, specifically at Real de Arriba and Tejupilco, during 1931 and 1932. Numerous specimens of Buprestidae collected by them in that region apparently were either incorrectly labeled "DF" or incorrectly attributed to that district by Fisher (1933), and were so recorded in the literature. Later, without noting the earlier error, Fisher (1938) correctly placed those localities in the State of Mexico. Therefore, numerous species described by him, notably in *Agrilus*, and recorded from DF, undoubtedly do not occur there. Hespenheide (1990) listed "DF" in the distribution of *Agrilus albofasciatus* Waterhouse, *A. cavatus* Chevrolat, *A. ixcuinae* Fisher, and *A. nodifrons* Waterhouse, all based on erroneously labeled specimens.

Abbreviations for the Mexican states, following U. S. Customs Directive No. 5610-002A, dated April 10, 2002 (reviewed April 2005), are provided here for convenience: AGS=Aguascalientes, BCN=Baja California, BCS=Baja California Sur, CAMP=Campeche, COAH=Coahuila, COL=Colima, CHIS=Chiapas, CHIH=Chihuahua, DGO=Durango, GTO=Guanajuato, GRO=Guerrero, HGO=Hidalgo, JAL=Jalisco, MEX=México, MICH=Michoacán, MOR=Morelos, NAY=Nayarít, NL=Nuevo León, OAX=Oaxaca, PUE=Puebla, QRO=Querétaro, QROO=Quintana Roo, SLP=San Luis Potosí, SIN=Sinaloa, SON=Sonora, TAB=Tabasco, TAMPS=Tamaulipas, TLAX=Tlaxcala, VER=Veracruz, YUC=Yucatán. ZAC=Zacatecas. Distrito Federal = DF. Unless otherwise indicated, collection and institutional codens follow the "Insect and Spider Collections of the World" web site, Bishop Museum: (www.bishopmuseum.org/bishop/ento/codens-r-us.html, as of January, 2006). Codens appear at the end of data and may refer to multiple records preceding them. Specimens designated as deposited in FSCA are from the collections of B. K. Dozier and G. H. Nelson, which have been donated to that institution.

Holotype male: 6.62 mm long, 1.59 mm wide across elytral humeri, 1.72 mm wide across abdominal sternite 2 as viewed from above, head with front and antennal segments 1–6 light metallic green, black on occiput with narrow coppery margin in front, outer antennal segments mostly black; pronotum with disk dull metallic blue-green, sides black with purplish coppery reflection; elytra brighter metallic blue-green, each with a broad bright metallic red lateral stripe extending 5/8 distance from base, then abruptly narrowing and dulling to near apex; beneath black with golden reflections medially and on legs. Vestiture white.

Head with eyes shallowly, yet notably emarginate internally; frons vase-shaped, more or less flattened, surface finely granulate, vertex finely striigate with a vague fine carina extending onto frons; vestiture moderately dense, short, recumbent; clypeus broadly shallowly emarginate, finely and sharply carinate at juncture with frons. Antennae with 4th segment weakly serrate, strongly serrate from 5th segment. Pronotum finely transversely rugose on disk, punctures fine and more evident basally, becoming confusedly rugose-punctate laterally; vestiture very short, sparse, recumbent; prehumeral carinae bold, strongly arcuate, covering basal 2/5; surface with disk shallowly convex, rather flattened laterally and with a broad oblique depression on either side mesad of prehumeral carina; front margin broadly bisinuate, distinctly lobed at middle; lateral margins gradually divergent to about basal 1/3 then subparallel to near apex where they converge to meet front margin in a narrowly triangular anterior angle; basal margin strongly sinuate on either side of broadly truncate median lobe, hind angles quadrate; submarginal carinae straight, sharp, extending to apical 1/5, converging with lateral margin well short of base. Scutellum microreticulate, finely indistinctly carinate, narrowly and triangularly projecting behind. Elytra coarsely, rather evenly imbricate-punctate, broadly depressed basally on either side, vestiture short, sparse, longer and more dense in depressions, subrecumbent; base strongly sinuately lobed on either side of scutellum; apices separately narrowly rounded, finely densely serrate; hind angles oblique. Pygidium black with strong golden reflection, moderately punctate, with a fine median carina that does not project. Underside: prosternum with mentonniere very shallowly arcuate at middle, widely deflexed; surface finely densely asperate-punctate, densely clothed with long setae; median process slightly expanding beyond coxal cavities, then converging to narrowly rounded apex. Abdomen with surface finely punctate, densely so on sternites 1 and 2, which are flattened but not grooved, more sparsely so on sternites 3–5; setae short, dense, recumbent at sides and on vertical portions, dense long and subrecumbent on middle of sternites 1–2 (especially) and 5, and more sparsely so on hind margins of sternites 3–4, somewhat sparse on middle of sternites 3–4; suture between sternites 1 and 2 distinctly indicated throughout, more boldly so at sides; sternite 5 broadly rounded, deeply grooved

following behind “double margin”; when viewed from above, sides of sternites 1–2 distinctly visible, that of sternite 3 less so. Hind coxae arcuately expanded internally, subtruncate externally to subquadrate outer margin. Legs with pro- and mesotibiae mucronate, metatibiae about 1.2 X long as metatarsi, the latter with basal tarsomere equal in length to next three combined; femora with dense long white setae along outer margin ventrally; tarsal claws with inner teeth stout, widely separated, those of protarsus longer, almost attaining length of outer claws. Aedeagus as in Figs. 3–4.

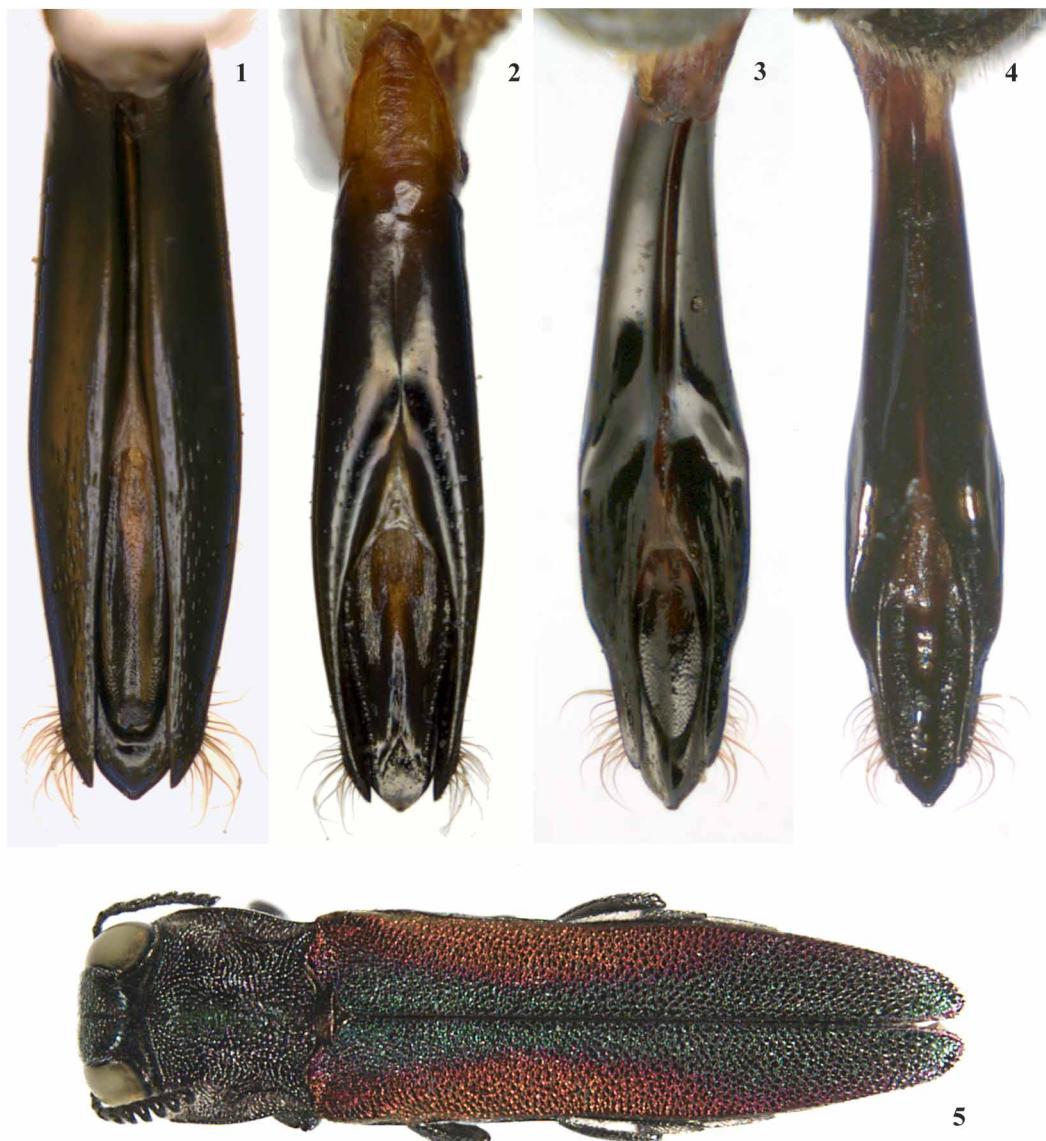

Allotype female: 6.43 mm long, 1.46 mm wide across elytral humeri, 1.72 mm wide across abdominal sternite 2 as viewed from above; differing from male as follows: front of head dark, with vague coppery reflection which is pronounced coppery-red below, more brassy on clypeus; antennae black; prosternum sparsely pubescent; abdominal sternites 1 and 2 with sides slightly more visible from above, more swollen and not flattened on middle, where setae are short and recumbent; legs with lower marginal setae of femora not so pronounced, especially on forefemur, tibiae without mucros, basal tarsomere about equal in length to next two combined.

Material examined: Holotype male (USNM) labeled “NICARAGUA, Rivas, vic. Rancho Santana, 6-7-XII-2003, Eric van den Berghe/on freshly fallen niño muerto, CAESALPINIA EXOSTEMMA (=C. *conzattii*)”; allotype female (USNM) from NICARAGUA, Granada, Domitila, on wood *Caesalpinia conzattii*, 14-15-III-2004, E. van den Berghe; 176 male, 116 female, and 8 unsexed paratypes, NICARAGUA, same data as holotype and allotype, plus Granada, Domitila, 26-30-XII-2003, 9 & 20-IV, 7-9 VI-2004; Volcán Mombacho, 18-V-2003; and Rivas, Chacocente-Astillero, 7-10-XII-2002; Playa La Flor, 2-V, 8-XI-97, 1-8-IV, 1-VIII-2000, 2-II-2004; Playa La Flor, reared ex wood *Caesalpinia conzattii*, III/IV-2004; Reserva La Flor, 29-30-XII-98, 16-18-II-2001, 16-18-VIII, 31-XII-2003; San Juan del Sur, 1-II-98; vic. Rancho Santana, 15-I, 6-IV-2004, all collected by E. van den Berghe; COSTA RICA, Guan., 3 km NO Nacaome, P.N. Barro Honda, 100 m, I-93, M. Reyes; GUATEMALA, El Progresso, 3.5 km E El Rancho, 15-16-VIII-79, E. L. Sleeper. Paratypes deposited in collections of P. Brandl, Kolbermoor; S. Gottwald, Berlin; E. Jendek, Bratislava; J. Marek, Prague; H. Mühle, Munich; G. Novak, Vienna; ACLC, BMNH, CASC, CEAM, CHAH, CLBC, CNC, DSVC, FSCA, GCWC, INBC, LACM, NMPC, RLWE, SEAN, SGWC, TCMC, WFBC, WFBM, UCDC, UNAM, USNM. Additionally, the following specimens have been examined but not made paratypes: MEXICO, Yucatán, 16 km N Felipe Carrillo Puerto, 2-VI-92, F. T. Hovore; X-can, V-67, E. C. Welling, CHAH; 120 km E Merida, nr. Chichen Itza, VI-VIII-68, E. C. Welling, FSCA.

Variation: Males vary in length from 5.09–7.71 mm, females from 5.22–7.71 mm. The green reflection on the pronotal disc varies in extent and distinctiveness; usually it is strongly evident, rarely it is evanescent. The lateral red elytral stripe always is distinct, yet it is variably developed in length. On some specimens there may be no evidence of it on the apical 1/4 to 1/3 of the elytra. In males, the frons sometimes exhibits coppery

reflections and may be golden green below, and commonly there is no coppery margin between it and the dark occiput. In females, the middle of the frons often shows green or blue-green reflection, sometimes golden green above, yet is always darker than on males.

Distribution: This species has been collected in Central America from Costa Rica to Guatemala, and on the Yucatán Peninsula of Mexico.

FIGURES 1–5. 1–4. aedeagi of *Agrilus* spp.: 1, *A. eyai* Westcott and Noguera, dorsal; 2, same, ventral; 3, *A. vandenbergheli* sp. nov., dorsal; 4, same, ventral. 5, dorsal habitus, *A. vandenbergheli* sp. nov.

Biology: According to Eric van den Berghe (in litt.), most specimens he collected in Nicaragua were on the trunk and branches of freshly fallen *Caesalpinia exostemma* (= *C.*

(*conzattii*), down less than a week and with leaves still green and moist. Mating was observed mostly on the trunk. One of us (RLW) has observed a similar habit with *Agrilus detractus* Waterhouse in Michoacán, Mexico, on downed leguminous trees.

Comparison: *Agrilus vandenberghaei* does not appear close to any described species of the genus known to us. In color pattern it superficially resembles *A. duncani* Knoll because of the participation of both species in the large mimicry complex whose models are clytrine chrysomelids (Hespenheide, 1996). Several other similarly mimetic, undescribed species of *Agrilus* are known from Mexico, one of which has been collected mostly in the western states and appears closely related to *A. vandenberghaei*.

Etymology: We name this species to honor Eric van den Berghe, who has collected many and varied Buprestidae, notably in Nicaragua, and whose generosity with specimens and biological observations has stimulated us to describe it.

***Agrilus aurilaterus* Waterhouse**

Agrilus aurilatera Waterhouse 1889:120

Although Waterhouse (1889) obviously was aware that the genus *Agrilus* is masculine, the feminine species epithet he used for this species has been of concern. It is a plural, the suffix being derived from the Latin noun *latus*. If this compound epithet were somehow construed to be a noun in apposition, then according to ICZN Article 11.9.1.2 it is incorrect, as such names must be singular. However, certainly it is an adjective. Therefore, according to ICZN Article 11.9.1.1 such a species-group name must be in the nominative singular. According to Don Cameron (University of Michigan), there are Late (Renaissance) Latin compound adjectives such as *longilaterus*, *multilaterus*, etc. which justify changing to *aurilaterus* to match the gender of the genus. Specimens of this uncommonly collected species were seen from JAL, Guadalajara, 1-VII-2003, MCZC, RLWE; Jocotepec, 15-VIII-87; 14 km W Magdalena, 1380 m, trop. decid. Forest, 7/8-VII-81, CLBC. Hespenheide (1974) reported this species from DF, Temascaltepec; however that district is in MEX (see comments in the introduction about specimens collected by Hinton).

***Agrilus aurulentus* Hespenheide**

MEX, 3 km E Sto. Tomás d. l. Platanos, 1424 m, 21-VIII-91, CLBC; MICH, 5.4 mi N Nueva Italia, 17-VI-87, FSCA.

***Agrilus catalinae* Knull**

SON, 10 mi SE Alamos, 29-VI-63, UCDC.

***Agrilus catherinae* (Chevrolat)**

The original spelling for this species (Chevrolat, 1835) was "catharinae"; however, in his description, Chevrolat (1835) stated: "Trouvé pour la première fois, par Mme Ve Sallé (Catherine)." According to ICZN Article 32.5.1, "catherinae" can be considered a justified emendation in that "catharinae" is a misspelling of the honoree's name. Without stating a reason, Waterhouse (1889) used "catherinae," as have all subsequent authors, so that the spelling can also be considered a justified emendation under ICZN Article 33.2.3.1. Both interpretations of the situation therefore favor "catherinae" as the correct name. CHIH, Guasaremos, Río Mayo, 5-Viii-35, CASC; VER, Cotaxtla, 19-VI-87, CLBC. Agrilus emarginatus (Waterhouse)

COL, Hwy. 110 at Tecolapa, 500', 20-VII-95, CLBC.

QROO, 5 km W Chetumal, Hwy. 186, 20-V-87, CLBC. In Mexico, this species had been known only from Jalisco.

***Agrilus exustus* Waterhouse**

CHIS, 2.3 mi W Las Cruces, 13-VII-62, CNC.

***Agrilus eyai* Westcott & Noguera**

This species was described (Westcott & Noguera 1995) from a single female collected from Mexico, Jalisco, Estación de Biología Chamela. A male from the same locality, collected 4-5-VII-75, RLWE, measuring 11.57 mm long, 3.08 mm wide, differs as follows: Less robust, elytra more tapering to apex; abdomen more flattened beneath, sides of second visible segment not visible from above; fore- and mesotibiae with a mucro on inner margin at apex; aedeagus as in Figs. 1 and 2. Another male, collected the same day, is in EBCC.

***Agrilus falli* Fisher**

CHIH, Cuauhtémoc, 16-VII-50, AMNH; JAL, Guadalajara, CMNH (**new record, Mexico**).

***Agrilus felix* Horn**

SON, 20 mi W Sonoyta, 13-VI-62, AMNH.

***Agrilus femoralis* Waterhouse**

NAY, 4.2 km WNW Cruz de Huanacaxtle, 30-VII-2-VIII-91, CLBC; SLP, Km 260, Hwy 85, 1 km SW Taman, 21°13'22", 98°52'55", 18-VI-2004, on *Celtis* sp., RLWE.

***Agrilus flavoguttatus* Waterhouse**

VER, 7 mi NE Mata Espino, 1-VII-71, TAMU. The species was recorded from "Mexico" by Maes *et al.* (1993), undoubtedly based on this record.

***Agrilus flohri* (Waterhouse)**

CHIH, El Limón, Río Mayo, 27-VII-56, CASC.

Agrilus fosseicollis Thomson

Acknowledgements

We wish especially to thank the following: C. L. Bellamy, CSCA, for allowing us to

include new records from his collection; A. Burgos, A. Equihua and J. Romero, CEAM, and F. Noguera, EBCC, for kindness and hospitality shown to one of us (RLW) which enabled field study in Mexico. Thanks go to F. Thompson, Systematic Entomology Lab, Washington DC and D. Cameron, University of Michigan for their nomenclatural opinions. G. H. Nelson (deceased) provided much significant data from his collection, which is now at FSCA; he was a good friend and colleague who will be sorely missed. Finally we are indebted to all the collectors, and curators of institutions indicated herein who provided data, either as records from their collections or specimens submitted for identification.
